PREFACE

Public procurement that is unrelated to infrastructure delivery typically relates to goods and services that are standard, well-defined and readily scoped and specified. Once purchased, goods invariably need to be taken into storage prior to being issued to employees. Services most often involve routine, repetitive services with well understood interim and final deliverables which do not require strategic inputs or require decisions to be made regarding the fitness for purpose of the service outputs.

In contrast, procurement relating to the provision of new infrastructure, or the rehabilitation, refurbishment or alteration of existing infrastructure covers a wide and diverse range of goods and services, which are required to provide or alter the condition of immovable assets on a site. Accordingly, the procurement process for the delivery of infrastructure involves the initial and subsequent recurring updating of planning processes at a portfolio level flowing out of an assessment of public sector service delivery requirements or business needs. Thereafter it involves planning at a project level and the procurement and management of a network of suppliers, including subcontractors, to produce a product on a site. There is no need to store and issue materials or equipment unless these are issued to employees responsible for the maintenance or operation of infrastructure or are issued free of charge to contractors for incorporation into the works.

Procurement is *the process which creates, manages and fulfils contracts*. Procurement deals with activities surrounding contracts. Such processes focus on establishing what is to be procured, developing a procurement strategy, producing procurement documentation, soliciting and evaluating tender offers, awarding of contracts and administering contracts. On the other hand, supply chain management (SCM) is *the design, planning, execution, control and monitoring of supply chain activities in the delivery of goods, services or any combination thereof*. Supply chains comprise all those public and private entities that are involved in delivering the inputs, outputs and outcomes of projects. Accordingly, supply chain

management is concerned with the oversight, co-ordination and monitoring of inputs, outputs and outcomes of projects from the various entities within a supply chain.

Infrastructure is defined as “*immovable assets which are acquired, constructed or which results from construction operations or moveable assets which cannot function independently from purpose built immovable assets*” while infrastructure delivery is defined as “*the combination of all planning, technical, administrative and managerial actions associated with the construction, supply, renovation, rehabilitation, alteration, maintenance, operation or disposal of infrastructure.*” Accordingly, infrastructure delivery management contextualises the supply chain management system for infrastructure.

Understandably, there are several overlaps between the supply chain management system for general goods and services and that for infrastructure delivery management. However, the inclusion of control frameworks in the Standard for Infrastructure Procurement and Delivery Management is aimed at expenditure control and a reduction in the gap between what is planned and budget for and what is delivered to ensure that value for money is achieved.

The primary purpose of this document is to embed an infrastructure delivery management system for George Municipality which is aligned with the regulatory framework for public sector procurement, supply chain management and expenditure control. It also enables the National Treasury Standard for Infrastructure Procurement and Delivery Management to be implemented.

This policy must be read in conjunction with the Supply Chain Management policy of George Municipality. Any discrepancies between the two policies would the Supply Chain Management Policy of the Municipality be regarded as the preferred version.
